What is a "Extension"?

Definitions

PostgreSQL extensibility is remarkable but incomplete.

Example (Basic SQL query)

```
SELECT col FROM table
```

WHERE stamped > date 'today' - interval '1 day'

Some extensions example

46 Contribs, Community extensions, Private ones...

- cube
- Itree
- citext
- hstore
- intagg

- adminpack
- pgq
- pg_trgm
- wildspeed
- dblink

- PostGIS
- ip4r
- temporal
- prefix
- pgfincore

- pgcrypto
- pg_stattuple
- pg_freespacemap
- pg_stat_statements
- pg_standby

PostgreSQL extensibility is remarkable but incomplete.

It lacks dump and restore support.

Before 9.1 and CREATE EXTENSION

Before 9.1 and CREATE EXTENSION

Example (Installing an extension before 9.1)

```
apt-get install postgresql-contrib-9.0
apt-get install postgresql-9.0-ip4r
psql -f /usr/share/postgresql/9.0/contrib/hstore.sql
```

- so, what did it install? ok, reading the script
- Oh, nice, it's all in the public schema
- Oh, very nice, no ALTER OPERATOR SET SCHEMA

Wait, it gets better

Example (Installing an extension before 9.1)

```
apt-get install postgresql-contrib-9.0
apt-get install postgresql-9.0-ip4r
psql -f /usr/share/postgresql/9.0/contrib/hstore.sql
```

- so, what did it install? ok, reading the script
- Oh, nice, it's all in the public schema
- Oh, very nice, no ALTER OPERATOR SET SCHEMA

Wait, it gets better

Example (Installing an extension before 9.1)

```
apt-get install postgresql-contrib-9.0
apt-get install postgresql-9.0-ip4r
psql -f /usr/share/postgresql/9.0/contrib/hstore.sql
```

- so, what did it install? ok, reading the script
- Oh, nice, it's all in the public schema
- Oh, very nice, no ALTER OPERATOR SET SCHEMA

Wait, it gets better

Example (Installing an extension before 9.1)

```
apt-get install postgresql-contrib-9.0
apt-get install postgresql-9.0-ip4r
psql -f /usr/share/postgresql/9.0/contrib/hstore.sql
```

- so, what did it install? ok, reading the script
- Oh, nice, it's all in the public schema
- Oh, very nice, no ALTER OPERATOR SET SCHEMA

Wait, it gets better!

Example (Installing an extension before 9.1)

```
apt-get install postgresql-contrib-9.0
apt-get install postgresql-9.0-ip4r
psql -f /usr/share/postgresql/9.0/contrib/hstore.sql
```

- so, what did it install? ok, reading the script
- Oh, nice, it's all in the public schema
- Oh, very nice, no ALTER OPERATOR SET SCHEMA

Wait, it gets better!

backup and restores

pg_dump -h remote mydb | psql fresh

- extensions objects are an entire part of your database
- but they are maintained elsewhere, that's just a dependency
- pg_dump makes no difference
- what about upgrading systems (system, database, extension)

backup and restores

- extensions objects are an entire part of your database
- but they are maintained elsewhere, that's just a dependency
- pg_dump makes no difference
- what about upgrading systems (system, database, extension)

backup and restores

Scope Specs Implementation details...

The extension specs & scope

What problems are we solving?

It's all about clearing up the mess. No feature is accepted in PostgreSQL without complete support for dump and restore nowadays. And that's good news.

Example (the goal: have pg_dump output this)

CREATE EXTENSION IF NOT EXISTS hatore WITH SCHEMA public

What problems are we solving?

It's all about clearing up the mess. No feature is accepted in PostgreSQL without complete support for dump and restore nowadays. And that's good news.

Example (the goal: have pg_dump output this)

CREATE EXTENSION IF NOT EXISTS hatore WITH SCHEMA public;

Scope Specs Implementation details...

Specs

- Rely on the OS to install the script and module
- Register the extension in the catalogs, to get an OID
- Track dependencies at CREATE EXTENSION time
- Adapt pg_dump
- Offer a WITH SCHEMA facility
- Offer ALTER EXTENSION SET SCHEMA
- Don't forget DROP EXTENSION RESTRICT | CASCADE
- Manage upgrading ALTER EXTENSION UPDATE

Extensions and user data

What if an extension gets modified after install?

- pg_dump support is all about excluding things from dumps
- some extensions install default data
- and allow users to edit them
- now you want the data in your dumps, right?

Extensions and user data

Implementation

The effort in figures

```
git diff -stat master..extension | tail -1 260 files changed, 4202 insertions(+), 2073 deletions(-)
```

```
git -no-pager diff -stat extension..upgrade | tail -1 125 files changed, 1976 insertions(+), 81 deletions(-)
```

- 5 patches, 7 branches, its own Commit Fest section
- about 18 months to get an agreement on what to develop first
- 2 Developer Meeting interventions, in Ottawa, PgCon
- 4 weeks full time, countless evenings, 3 months of refining

Conclusion

PGXS and the control file Extensions Upgrades Extensions and packaging

PGXS and the control file

Using PGXS

Simpler way to have your files installed at the right place, using make install. But Makefiles are hard, right?

```
MODULES = citext

EXTENSION = citext

DATA = citext--1.0.sql citext--unpackaged--1.0.sql
```

Using PGXS

Simpler way to have your files installed at the right place, using make install. But Makefiles are hard, right?

Example (citext/Makefile)

```
MODULES = citext

EXTENSION = citext

DATA = citext--1.0.sql citext--unpackaged--1.0.sql

REGRESS = citext
```

The control file

It's a very complex file containing the *meta data* that PostgreSQL needs to know about to be able to register your *extension* in its *system catalogs*. It looks like this:

```
Example (citext.control)
# citext extension
comment = 'data type for case-insensitive character strings
default_version = '1.0'
module_pathname = '$libdir/citext'
relocatable = true
```

The control file

It's a very complex file containing the *meta data* that PostgreSQL needs to know about to be able to register your *extension* in its *system catalogs*. It looks like this:

Example (citext.control)

```
# citext extension
comment = 'data type for case-insensitive character strings
default_version = '1.0'
module_pathname = '$libdir/citext'
relocatable = true
```

relocatable

A relocatable extension installs all its object into the first schema of the search_path.

It's then possible to ALTER EXTENSION SET SCHEMA.

not relocatable

An extension that needs to know where some of its objects are installed is not relocatable. The extension installation script is then required to use the <code>@extschema@ placeholer</code> as the schema to work with.

Example (tsearch2/tsearch2-unpackaged-1.0.sql)

ALTER EXTENSION tsearch2 ADD type @extschema@.tsvector; ALTER EXTENSION tsearch2 ADD type @extschema@.tsquery;

Extension Configuration Tables

```
Example (Flag your pg_dump worthy objects)

CREATE TABLE my_config (key text, value text);

SELECT pg_catalog.pg_extension_config_dump('my_config', '')

CREATE TABLE my_config (key text, value text, standard_entry);

SELECT pg_catalog.pg_extension_config_dump('my_config', 'WHERE NOT standard_entry');
```

Agenda
What's an Extension?
The extension specs & scope
Extension for their authors: YOU.
Conclusion

PGXS and the control file Extensions Upgrades Extensions and packaging

Extension Upgrades

- Versions "numbers" are just strings
- Provide scripts extension-old-new.sql
- Updates only refer to changes in the SQL script
- Secondary control files extension-new.control

- Versions "numbers" are just strings
- Provide scripts extension-old-new.sql
- Updates only refer to changes in the SQL script
- Secondary control files extension-new.control

- Versions "numbers" are just strings
- Provide scripts extension-old-new.sql
- Updates only refer to changes in the SQL script
- Secondary control files extension-new.control

- Versions "numbers" are just strings
- Provide scripts extension-old-new.sql
- Updates only refer to changes in the SQL script
- Secondary control files extension-new.control

ALTER EXTENSION ... UPDATE [TO VERSION];

- system view pg_available_extensions
- system view pg_available_extension_versions
- CREATE EXTENSION ... FORM old_versions

Example (hstore-unpackaged-1.0.sql)

```
ALTER EXTENSION hstore ADD type hstore;
ALTER EXTENSION hstore ADD function hstore_in(cstring);
ALTER EXTENSION hstore ADD function hstore_out(hstore);
...
```

Upgrade Scripts

Extension author has to provide scripts for all supported upgrades

- PostgreSQL handles upgrade paths
- 1.0-1.1 then 1.1-1.2
- system view pg_available_extension_versions
- Be careful about downgrade paths!

PGXS and the control file Extensions Upgrades Extensions and packaging

Extension and packaging

debian and pg_buildext

Contributed and available in *debian squeeze*, postgresql-server-dev-all

Example (debian/pgversions)

8.4

9.0

debian and pg_buildext

Contributed and available in *debian squeeze*, postgresql-server-dev-all

Example (debian/rules)

```
include /usr/share/postgresql-common/pgxs_debian_control.mk
install: build
# build all supported version
pg_buildext build $(SRCDIR) $(TARGET) "$(CFLAGS)"

# then install each of them
for v in 'pg_buildext supported-versions $(SRCDIR)'; do \
dh_install -ppostgresql-$$v-pgfincore; \
done
```

Sponsoring Any question?

Conclusion

Money

4 week full time at home, thanks to 2ndQuadrant, and to our affiliation with European Research

The research leading to these results has received funding from the European Union's Seventh Framework Programme (FP7/2007-2013) under grant agreement 258862

Any question?

Now is a pretty good time to ask!
